

With our experience from more than 10 years in this field, we will optimize and document your IT infrastructure, generate an individual system specification and provide you with high quality planning.

The aim is to achieve the maximum essential performance with the greatest possible cost-effectiveness.

We also support you during the implementation of the plans that are prepared. Setting up networks with server systems, providing access for various sites and mobile access are a part of this, as is the staff-focused design of workstations, protection against unauthorized access and the application of central data security systems.

You can even count on us during ongoing operation of your IT. We service your hardware and software and support your software users - on site or remotely.

// STAFF ADVANCEMENT

PEOPLE AS A FACTOR IN OUR SUCCESS.

The staff are the backbone of a company.

Those roles and tasks are then coordinated within the organizational structure of the company in order to lead to business success.

Staff prerequisites for digital product development include:

- // Industry-specific expertise
- // Knowledge of the company's own processes
- // Specialist knowledge of the software used

We offer you basic and advanced training courses, workshops, information events and meetings, as well as individual sessions at the employee's workstation. Create a structure in which colleagues do not distract one another from key tasks by asking each other questions.

Choose a professional and efficient method to train your staff. Invest in the future of your company. The results will be measurable – in the satisfaction of your staff and the success of your company.

Please feel free to also contact us about team building, interim management and methods for safeguarding company expertise.

More information is available in our Staff Advancement brochure.

CONSULTING ENGINEERS.

CONSULTING ENGINEERS.

DGProject is an experienced company working in the field of product lifecycle management. With a focus on consultancy and service, as well as on engineering and training, we offer you product-neutral, cross-industry services along the digital product development chain. Find out more about DGProject and discover the added value we can offer you.

SERVICE IS DEFINED BY PERFORMANCE.

Client relationships are partnerships limited in time. In our case, usually a long time. When it comes to client relationships, it is important to us to customize our range of services directly to the needs of our clients. Because in the end, it's the result that counts.

The DGProject team will accompany you into the world of product lifecycle management (PLM).

15 years of experience in the following areas:

- // PLM services (process and system integration, improvement in efficiency through automation, documentation and user support)
- // Engineering (aviation, automotive, plastics)
- // Staff advancement (CAD/PDM/CM)
- // IT consulting

We provide you with advice that is not dependent on one product and support you in the introduction, implementation and optimization of your internal procedures and processes.

With a flat structure and a flexible, transparent team, we place the emphasis on what really counts: the quality of our services.

// PLM SERVICES

THE PHILOSOPHY OF SUCCESS.

Product lifecycle management (PLM) is a concept, a strategy, perhaps even a philosophy. In fact, PLM is nothing new and it is not the same thing as PDM (product data management). We understand PLM as a company-specific concept for controlling and managing product and process-related data throughout the entire product lifecycle. In it the tasks of everyone involved, the entire communication system and all of the product-related information must be coordinated and made available in an effective way.

Processes, methods and tools determine the effectiveness of the product development.

- // Can you imagine improving your competitiveness?
- // Have you already taken advantage of your optimization potential?
- // Are procedural adaptations necessary due to changes to basic conditions?

DGProject provides you with the answers with its PLM services, which focus on digital product development - the point at which incoming information and orders are processed and at which results and data that you must be able to rely on are created.

We work with you to analyze the following success factors:

- // Command of the complexities of the product and process
- // Holistic understanding of processes
- // Efficient, transparent processes and rapid implementation of process adaptations
- // Roles, tasks and responsibilities of your staff
- // Information flows in your company
- // Central, up-to-date data maintenance (information processing)
- // Supplier integration
- // Tools (software), IT infrastructure, interfaces

You can find more information in our Automation and Documentation brochures.

// ENGINEERING

EXPERTS FOR ALL STAGES IN THE PRODUCT CYCLE.

We have provided support for the entire design process of products in the construction of aircraft and vehicles. Our range of experience starts with prototype construction and extends through series construction to tool construction in small and large series. Thanks to the consultancy expertise in our company, our designers are also perfectly prepared for your field of activity and contribute to providing our clients with considerably more added value. Whether it's in developing a technical draft or taking the lead with a complex engineering work package – our aim is to demonstrate the added value we provide.

Our engineering services at a glance:

- // Prototype construction with concept phase
- // Series construction for small and large series
- // Tool construction
- // Support for series production
- // Product optimization
- // Project management

We identify your optimization potential in the entire engineering process and make suggestions for automation, standardizations and improvements to processes.

// IT CONSULTING

STRUCTURE FOR BITS AND BYTES.

Structural changes to IT landscapes require an accurate analysis of needs. Transparent communication and documentation is the foundation for these change processes.

You can benefit from our service modules in the field of IT consulting
